

## Photochemistry, Photophysics, Photocatalysis

### Table of contents:

1. Introduction 1: Revision of Fundamental Concepts. *Atomic Orbitals. States. Russell-Saunders Term Symbols. Racah Parameter.*
2. Introduction 1: Revision of Fundamental Concepts. *Tanabe-Sugano Diagrams. Selection Rules.*
3. The excited state. Construction, description, quenching. *Potential Energy Surfaces. The Franck-Condon Principle. Radiative and non-radiative decay.*
4. Reactivity in the excited state. *Diabatic Reactions. Adiabatic Reactions. Electron Transfer in the Excited State. Marcus Theory.*
5. Electron Transfer, Energy Transfer and introduction to Photoredox Catalysis. *The Stern-Volmer Experiment. Interaction of matter with light.*
6. Application of photochemical processes in organic and organometallic chemistry. *History of Photoredox catalysis. Organophotocatalysis. Photoredox catalysis with transition metals. Energy Transfer Photocatalysis.*
